Solution: The Standard Library

Quiz Solution: Password Generator

To create random passwords we used `import random`. The function definition was simply:

```
def generate_password():  
    return random.choice(word_list) + random.choice(word_list) + random.choice(word_list)
```

Alternatively, you could use the `random.sample` function and `.join` method for strings:

```
def generate_password():  
    return ''.join(random.sample(word_list, 3))
```
