Solution: Documentation

Quiz Solution: `readable_timedelta`

Here's some ways you could've written your docstring!

```
def readable_timedelta(days):  
    """Return a string of the number of weeks and days included in days."""  
    weeks = days // 7  
    remainder = days % 7  
    return "{} week(s) and {} day(s)".format(weeks, remainder)
```

```
def readable_timedelta(days):  
    """Return a string of the number of weeks and days included in days.  
  
    Args:  
        days (int): number of days to convert  
    """  
    weeks = days // 7  
    remainder = days % 7  
    return "{} week(s) and {} day(s)".format(weeks, remainder)
```

Solution: Documentation

Return a string of the number of weeks and days included in days.

Parameters:

days -- number of days to convert (int)

Returns:

string of the number of weeks and days included in days

"""

```
weeks = days // 7
```

```
remainder = days % 7
```

```
return "{} week(s) and {} day(s)".format(weeks, remainder)
```
