Solution: Dictionaries and Identity Operators

Solution: Define a Dictionary

We can define the dictionary like this:

```
>>> population = {'Shanghai': 17.8,  
                  'Istanbul': 13.3,  
                  'Karachi': 13.0,  
                  'Mumbai': 12.5}
```

I chose to put each key-value pair on its own line to make this dictionary definition easier to read, but where and whether you use line breaks is simply a stylistic choice. This code works just as well:

```
>>> population = {'Shanghai': 17.8, 'Istanbul': 13.3, 'Karachi': 13.0, 'Mumbai': 12.5}
```
